B K TEXTILE requirements and work register

Prepared for B.K. TEXTILE management and department heads. Handover date: 2 November 2026. Source reviewed: release 2.4.1.

This document consolidates the requirements expressed in this chat and the work reflected in the packaged source. Implemented means code exists; it does not certify successful installation on the live host, completeness of business data or correctness of unreviewed extraction. Partial automation and future deployment work are identified explicitly.

Business and team scope

B.K. TEXTILE manufactures garments with in-house cutting, stitching, finishing and packaging, while yarn, knitting and dyeing are outsourced. The shared workflow covers Merchandising, Fabrication, Sampling, Accessories and trims, greige/dyed warehouses, Cutting, Stitching, Finishing and packing, Export and Accounts. Embellishment and Fabric or Garment Processing were added with in-house or supplier execution.

Merchandising owns prices/quantities, allowances, schedule inputs and previous references. Fabrication owns fabric quality/consumption, process inputs and final material acceptance. Sampling owns measurements and styling. Departments record their own instructions/progress. Accounts records bills, terms, cheques and clearance. Admin manages users and follows up delays. Shared reading is broad; department write and approval ownership is enforced by the backend.

Requirements register

R01 Shared company software

Requested: Easy software for B.K. TEXTILE, used by several staff on different computers or phones.

Delivered: A browser-based local server with individual accounts and shared SQLite records. LAN mode is available. Outside-office access and a hosted cloud service have not been deployed.

R02 Buyer order and picture extraction

Requested: Attach the customer Excel order and JPEG image so the software reads fabric quality/content, quantities, customer PO, style, price and delivery requirements and prepares a programme.

Delivered with limits: Excel cell extraction and recognized draft suggestions, new-order review and photo attachment. Arbitrary customer layouts are not universally understood. Photos are styling references and do not determine hidden composition, GSM, measurements or price. Departments must review their fields.

R03 Original CB2210 example

Requested: Use 25362 BK CB2210.xls and CB2210.jpg as an example. Owner confirmed the example's price and quantity.

Delivered: A separate example order and previews, with source references. It is distinguished from live orders. Example content is not automatically imported into new business orders.

R04 Size quantities and allowances

Requested: Show size-wise quantities and allow custom percentages such as 3 or 5 percent, entered by Merchandising.

Delivered: Buyer quantity, planned cutting quantity and actual production by size. Cutting extras round up to whole garments per size. Fabric allowance is separate and does not increase buyer shipment quantity or selling value.

R05 Fabrication owned consumption

Requested: Each order's consumption differs, and only Fabrication should enter it.

Delivered: Independent order consumption with server-enforced Fabrication editing. Commercial or Admin accounts do not bypass this ownership.

R06 Fabric consumption calculator

Requested: Width in tube/open form, fabric length, quantity, wastage and GSM should calculate consumption automatically.

Delivered: Per-size/per-fabric calculations with width/length units, doubled laid-flat tube width and separate waste factors. The entered length must be the fabric/marker length for the entered garment count, not garment body length. Inputs remain required.

R07 Multiple fabrics per garment

Requested: A hoodie can use fleece for body, jersey for hood lining and rib for cuffs/bottom band, each with its own consumption.

Delivered in v2.4: Separate fabric identities, names, garment item/use, quality, content, colour, GSM, width and consumption. Manual values support kg/piece or kg/dozen; calculators are independent by size. Unused bottom fabric can be removed for a single hoodie. Each saved physical fabric line is counted once.

R08 Multiple fabric calculations downstream

Requested: Additional fabrics must be reflected in fabrication and production programmes.

Delivered: Separate finished/greige/yarn calculations, per-fabric process inputs and optional mill/loss overrides. Receipts identify the exact fabric. Cutting balances are separate per fabric. Legacy receipts are not automatically reclassified into new fabric identities.

R09 Sampling and specification ownership

Requested: Measurements/specifications differ by item and must be entered and styling-approved by Sampling.

Delivered: Measurement point, Top/Bottom/Other item, size, value, cm/inch and tolerance; construction/styling notes and Sampling approval. Exact measurements are not inferred from a photo.

R10 Excel specification import

Requested: Add Excel upload in Sampling and specs.

Delivered: Worksheet/header selection, column mapping, rows per size or size columns, defaults for item/unit/tolerance, preview and append/replace. Invalid sizes, text values and duplicates are flagged. Applying preview updates the form; saving persists it and resets styling approval.

R11 Department approvals

Requested: Sampling approves styling, Merchandising approves price/quantity and Fabrication approves fabric quality.

Delivered: Server-side ownership and approvals. Production/dispatch checks require approvals and available stage quantities. Received-lot inspection acceptance is a separate action from fabric specification approval.

R12 Department lead times and schedule repair

Requested: Merchandising enters each department's days and responsible person; the system evaluates the schedule. Saving the entered schedule must work.

Delivered: Backward working-day planning with dependencies, responsible people, loop diagnostics, preserved drafts and prepared baselines. Invalid dependencies or uncovered calendars explain why release is blocked rather than silently doing nothing.

R13 Sundays and national public holidays

Requested: Exclude Sundays and Pakistan national holidays only.

Delivered with maintenance requirement: Sundays and listed holidays are excluded. Saturdays are working days. The scheduler refuses dates outside reviewed calendar coverage. National holidays are entered/reviewed by management; lunar or newly declared dates are not fetched automatically. Initial sample coverage is limited and must be maintained.

R14 Delay dashboard and explanations

Requested: Flash overdue work across departments so Admin/Merchandising can ask why it is late.

Delivered: Overdue/due/completed views, optional slow flashing, order/department filters, assigned department explanations and corrective/recovery dates, with manager review/closure. Asking for a reason does not move the original deadline. Messages remain in the app.

R15 Yarn requirement and purchase units

Requested: Show required yarn bags with 45.36 kg as the usual bag weight; polyester and spandex are bought in kg.

Delivered: Editable per-yarn bag weights, whole-bag rounding and kg-only polyester/spandex. Matching yarn/mill specifications are pooled before rounding. Bag surplus is shown; existing yarn stock is not automatically deducted from gross requirements.

R16 Knitting and dyeing details

Requested: Knitting programme with dia, gauge, quantity, quality and full details; dyeing programme showing kg to issue.

Delivered: Yarn recipe/count, stitch length, greige GSM/width, lot, shade, finish/testing instructions, mill assignments, input losses and target quantities. Greige input is calculated from finished need and dyeing loss; yarn input from greige and knitting loss. Printing does not post a warehouse dispatch.

R17 Editable mill names including spinning

Requested: Add/change spinning, knitting and dyeing mills without asking the developer.

Delivered: Self-service mill directory, contact/address/activity and assignments. Spinning mills can be assigned per yarn recipe. The general supplier directory supplies fuller payment/delivery profiles for accessories, embellishment and processing.

R18 Formal mill orders and record copies

Requested: Issue printable order forms to spinning, knitting and dyeing mills, and keep a file copy.

Delivered: Numbered yarn purchase and knitting/dyeing job order sheets, supplier grouping, saved immutable HTML copies and print/PDF access. Agreed rates/terms and signatures remain necessary where blank. The software does not send the order externally.

R19 Greige defects and own acceptance limits

Requested: Greige department checks received fabric, records defects and rejects excessive issues using company-defined limits.

Delivered: Custom defect types, counts/rates, critical rules, Accepted/Rejected/Hold evaluations and Fabrication finalization. Missing required limits/tests result in Hold rather than assumed acceptance.

R20 Dyed fabric tests

Requested: After dyeing, check defects plus shrinkage and colour fastness.

Delivered: Measured before/after length and width, shrinkage or growth limits, configured fastness grades and printable inspection copies. These evaluate company-entered criteria; they do not certify an external test method automatically.

R21 Cutting shortfall and overages

Requested: Show cutting shortfall and highlight fabric remaining after cutting.

Delivered: Issued minus used/spread balance, estimated fabric needed for remaining cuts, kg shortage/surplus, and size-wise good-cut shortage/overage. Fabric balances now separate fleece, lining, rib and other fabrics. Actual counts still need recording.

R22 Complete receiving records

Requested: Record yarn, greige and dyed deliveries with quantities, finished width, quality, challan number, vehicle and related details.

Delivered: Receiving registers, dates, lots, rolls, width presentation/units, GSM, bags/kg and originals where uploaded. Fabric receipts post pending-quality warehouse stock; final acceptance gates issue/payment readiness. Different fabrics require distinct lot references.

R23 Scan and extract mill challans

Requested: Scan/upload spinning, knitting and dyeing challans so details are extracted and programmes updated without typing.

Delivered partially: Offline browser OCR/PDF handling, English/Urdu assets, labelled-field parsing, registered mill matching, source evidence/warnings, original retention and receipt approval. Unfamiliar layouts, handwriting, multiple line items or missing data are not guaranteed automatic. Human review is required before stock is posted.

R24 Preference for no manual entry

Requested: Avoid manual entries.

Current limit: Universal zero-entry automation is not fulfilled. Missing facts, rates, supplier matches, garment specifications, process instructions, test results, limits and approvals may still require entry or review. The software must not invent them.

R25 Accounts readiness and payment terms

Requested: Once Fabrication finalizes fabric acceptance, Accounts should see payment eligibility under agreed mill terms.

Delivered: Receipt/QC-linked payables, terms and due dates, acceptance gating, balances and payment records. Eligibility is not an automatic transfer or substitute for Accounts authorization.

R26 Cheque completion

Requested: Mark the action/file completed when Accounts issues a cheque.

Delivered: Issued-cheque completion, partial balances and separate cleared status. This is bookkeeping; no bank connection, cheque printing or money transfer is implemented. It is not a complete certified general ledger.

R27 Readiness for Sampling and Cutting

Requested: Final fabric approval should also tell Sampling it can make samples and Cutting it can plan trials.

Delivered: Shared readiness view, current finalized accepted lots and positive stock, with dyed fabric distinct from greige. In-app updates do not send WhatsApp/email/SMS. Styling and bulk approvals remain separate.

R28 New orders pictures and numbering

Requested: Add subsequent POs and images, with number/BK-customer initials/year, starting at 4056.

Delivered: Merchandising order creation/import, independent order data, photo attachments by Merchandising/Sampling, and transaction-based numbering. Latest source starts each year's shared series at 4056, advances above existing issued sequences and preserves assigned numbers. Customer PO is separate. This is an internal reference, not a statutory tax invoice certification.

R29 Accessories and trims department

Requested: Add the supplied full list of materials and permit additions; select supplier/items and generate printable orders.

Delivered: 41 seeded materials, custom additions/deactivation, specifications, colour/size, quantities, units, rate/currency, dates, arranged quantity and grouped saved purchase orders for outstanding need.

R30 Full supplier information

Requested: Supplier name, address, contacts, payment terms, delivery terms and related details.

Delivered: Supplier master with contact person, phone/email, address/city/country, website, tax reference, terms, lead days, currency, activity and department services. Saved documents retain the profile as it stood when prepared.

R31 Embellishment department

Requested: Embroidery, screen print, stone work, rubber/flock print and more, with programmes that can be printed for the department.

Delivered: Editable technique catalogue, in-house/outside supplier selection, artwork/reference, placement/dimensions/colours, QC instructions, quantities/dates, rates and saved printable job orders.

R32 Fabric and garment processing department

Requested: In-house or outsourced washing/dyeing techniques, full supplier information and POs, with more washes added later.

Delivered: Ten requested starting techniques plus additions, batch/item/reference, instructions, quality requirements, quantity/unit, date, execution, supplier and printable order copies. Catalogue names do not imply validated chemical recipes.

R33 Automatic department programmes

Requested: After order, photo, spec sheet and necessary details, automatically generate fabrication, cutting, stitching, finishing/packaging, optional embellishment and processing programmes.

Delivered: Programmes from saved source revisions, with invoice/PO/style, photo if attached, size quantities, separate fabric data, measurements, relevant trims/process details, schedule and instructions. Unknown instructions are not invented. Missing requirements keep reports marked DRAFT; present data/approvals produce PREPARED for department review.

R34 Cutting and fabrication format references

Requested: Use Cutting program.xlsx and fabrication program.pdf as reference formats.

Delivered: Reviewed the cutting size/colour/allowance table and scanned dyeing programme for invoice, reference, dia/gauge, GSM/width, colour, kg and yarn bags. Reports carry this information with whole-piece cutting rounding. Handwritten changes were layout/business context, not authorization to overwrite live records.

R35 Runnable software and update fixes

Requested: Provide final runnable software, permit modifications and fix missing calculator/update failures.

Delivered: Multiple Windows packages and updates. v2.4.1 includes omitted offline scanner assets and improved process identification/diagnostics. Separate payload checks passed. The last troubleshooting did not confirm the live host successfully updated; installation must be verified there.

R36 Archive and technical handover

Requested: ZIP all patches/updates, document JSON commands/backend code, explain local/web storage and remote access, and record all work/extraction requirements.

Delivered by this handover: 11 available historical ZIPs, clean current runnable software, backend/frontend source, tests, valid JSON examples, command reference, actual schema, hashes, installation guide and this register. Live records and credentials are deliberately excluded.

Original catalogue lists

Accessories: Thread; Elastic; Twill Tape; Heavy Twill Tape; Tubular Tape; Round Drawcord; Twill Fabric; Buttons; Snap Buttons; Snap Diamond Buttons; Zippers; Sliders; Leather Patch; Main Label; Care Label; PO Label; Brand Label; Flag Label; Size Labels; Heat Transfer Label; Tracking Label; Hang Tag; Disclaimer Tag; Gift Tag; Price Ticket; Size Strip; Inlay Card; Dori; Safety Pin; Tack Pin; Tissue; Individual Polybags; Master Polybag; UPC Stickers; Barcode Stickers; Carton Stickers; Cartons; Carton Sheets; Picture Stickers; Ratio Stickers; Round Size Stickers.

Embellishment: Embroidery, Screen Print, Stone Work, Rubber Print and Flock Print, with custom additions.

Processing: Roll Wash, Panel Wash, Garment Pigment Dyed, Garment Direct Dyed, Garment Acid Wash, Garment Mineral Wash, Garment Burnout, Garment Burn Wash, Garment Silicon Wash and Garment Snow Wash, with custom additions. Silicon Wash follows the original requested name. The

team supplies the approved recipe, testing and quality requirements.

Extraction fields and review rules

Buyer extraction requirements include customer, customer PO, style/description, fabric quality/content, GSM/width, colour/shade, size quantities, garment price, delivery and style instructions. Recognized Excel fields are draft suggestions. Merchandising confirms commercial details, Fabrication confirms fabrics and Sampling confirms specifications/style.

Measurement import supports worksheet/header choice and mapped columns for garment item, measurement point, size, value, unit and tolerance. It supports rows per size or sizes across columns, preview and append/replace. Invalid/duplicate values must be corrected. A garment photograph does not supply exact measurements.

Challan extraction requirements include mill/type, date, challan number, vehicle, lot, quality, yarn count, bags/kg, rolls, finished width presentation/unit and GSM. Labelled fields, exact mill matching and ambiguity warnings are implemented. Selecting a fabric identity, confirming dates and resolving multi-item scans may still be manual. File text is treated as business data, not instructions to execute code, change users or send messages.

The cutting example has PO 25362/style CB2210, red top/navy capri and size quantities 55, 175, 180, 115, 50 and 25. It includes a 3 percent extra-cut column with fractional rows and total rounding inconsistencies. The software rounds up per size to whole garments, so the resulting total can exceed 600 times 1.03. The scanned fabrication reference is a dyeing programme with typed and handwritten kg/bag changes; those quantities were not imported into live orders.

Work by release and known update history

v1.0 established the runnable shared departmental application. v1.1-era changes addressed the fabric calculator/access. v1.2 added fabrication reports, and v1.2.1 spinning mill management/yarn assignment. v2.0 consolidated receiving, QC, payables, fabric readiness and challan functionality. v2.1 added automatic references and v2.1.1 schedule diagnostics/draft behavior.

Dashboard work was incorporated in v2.3 together with accessories, embellishment, processing, supplier profiles, printable programmes and Excel spec import. v2.4 introduced multiple fabrics and automatic department report snapshots. v2.4.1 repaired the complete updater by supplying OCR assets needed by an older v1.1 installation and improving process detection/diagnostics. No separate v2.2 release ZIP is available.

Earlier archives and screenshots are retained for traceability. They are not an instruction to apply obsolete patches or proof that those releases are installed now. Current installation status remains subject to checking /api/version on the actual host. This handover does not install or update that host.

Services and automation not yet deployed

No public-web deployment, outside-office access, HTTPS/domain configuration, cloud database, automatic synchronization or scheduled off-site backup was deployed. No bank transfer, automatic external supplier order transmission, WhatsApp/email/SMS alert service or universal zero-review extraction exists. Payroll, full ERP general ledger, statutory tax invoices and compliance certification are outside the implemented scope.

Staff still need training and factory acceptance testing. Department permissions restrict edits/approvals but do not provide a custom confidential-record visibility policy for every team. Programme instructions, agreed rates, test methods, acceptance limits and actual production/receipt data must be supplied by responsible people.

Verification and follow-up work

Checks cover ownership, stale saves, tube/open units and allowances, schedule loops/calendars, independent orders, numbering uniqueness, yarn recipes/bags, supplier-specific immutable copies, receipt/QC/payment rules, cutting balances, department catalogues, multiple fabrics and spec parsing. Selected screens and printable forms were visually checked; folder 06 previews show examples or test data, not a live factory status.

For this handover, the complete source ran against disposable data and returned 2.4.1 with its expected feature flags. The SQLite schema was captured from that disposable database. Historical ZIPs were inspected for data files; no live business database is included. The current app/source were copied without their working data directories. No production passwords, sessions, uploaded buyer files or original challans are bundled.

Next steps: confirm host/data folder/live version, test actual buyer/spec/challan layouts, review holiday coverage, validate reports with department heads, appoint backup ownership and test full restoration, try a second LAN device, and decide whether IT should implement outside-office access. These are remaining deployment/acceptance tasks rather than completed assumptions.
